## High-throughput sequencing technologies

- ✧ Millions of reads
- ✧ Low cost
- ✧ cDNA samples (RNA-seq) :
  - transcriptome of eukaryotic genomes
  - gene expression measurement
  - unbiased and comprehensive manner for analyzing transcriptome
- ✧ Mapping high-throughput sequencing tools
- ✧ Mapped reads analysis tools?

# S-MART<sup>[1]</sup>

--analysis of mapped RNA-seq and CHIP-seq

- **Conversion : Gff\*, csv, sam, fastq, fasta, ...**
- **WIG : exploit Wig information**
- **Merge**
- **Comparison**
- **Selection : Exon, Intron, Flanking, ...**
- **Modification : genomic coordinates, sequence, adaptor**
- **Visualization**

- [1] : *Zytnicki M, Quesneville H (2011) S-MART, A Software Toolbox to Aid RNA-seq Data Analysis. PLoS ONE 6 (10):e25988.doi:10.1371/journal.pone.0025988*

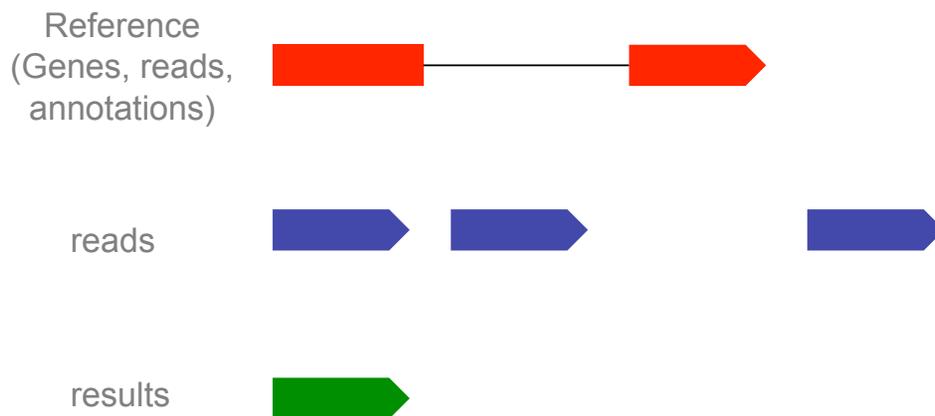

# S-MART

## --Tools for RNA-seq

# S-MART

## --Tools for RNA-seq

CompareOverlapping :  $O(N)$ , where N is the number of short reads. 1h30->20 million reads VS. 250 thousand ref transcripts.

Options :

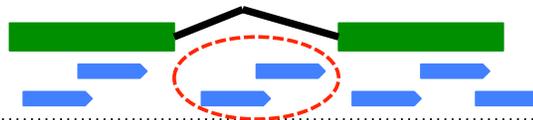

Restrict to N first nucleotides :

Extension on 5' or 3' direction :

Report introns :

Invert selection :

Colinear/Anti-sense :

Included :

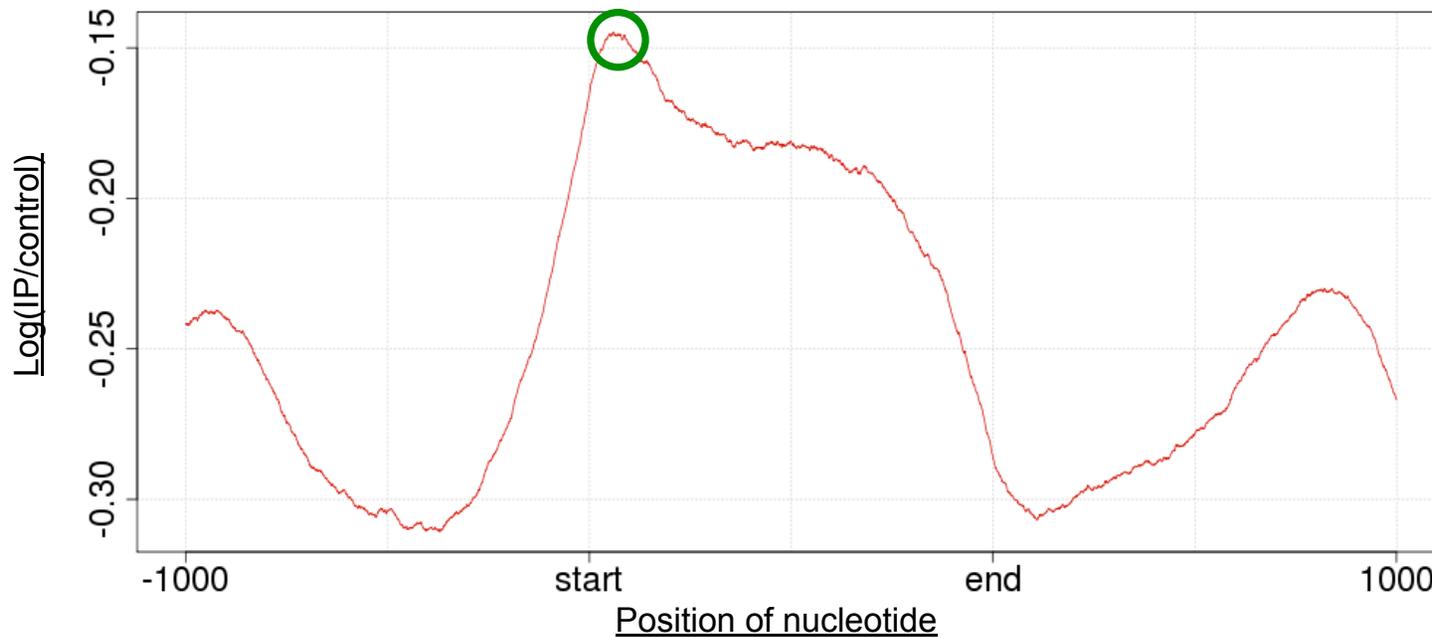

# S-MART

## --Tools for ChIP-seq

- **getWigProfile**

Wiggle (WIG): display of dense, continuous data (GC percent, probability scores, transcriptome data), the value of each genome nucleotide

# S-MART in Galaxy

## --pipelines

The Galaxy team is a part of BX at Penn State.  
This project is supported in part by NSF, NHGRI, and the Huck Institutes of the Life Sciences.

**Galaxy is installed on URGI cluster with:**

- CPU: **912 (Intel Xeon) / 79 nodes**
- RAM max: **512 Gb per job**
- Entry point 1: **node « www »**
- Entry point 2: **node « ssh »**

Using Sun Grid Engine (for job management) and a PostgreSQL Database (for Galaxy).

# S-MART in Galaxy

## --pipelines

The screenshot shows the Galaxy web interface. The top navigation bar includes 'Analyze Data', 'Workflow', 'Shared Data', 'Visualization', 'Help', and 'User'. The 'Tools' sidebar on the left lists various categories: NGS: Peak Calling, NGS: Simulation, SNP/WGA: Data; Filters, SNP/WGA: QC; LD; Plots, SNP/WGA: Statistical Models, Human Genome Variation, Genome Diversity, VCF Tools, URGI TOOLS, and APLIBIO TOOLS. Under URGI TOOLS, the 'URGI: S-MART' pipeline is highlighted with a red box. The main workspace displays the URGI logo and the INRA logo. The 'History' sidebar on the right shows a list of recent jobs, including '210: Trim sequences on data 208', '209: FastQC.html', '208: Trim sequences on data 206', '207: FastQC.html', '206: Trim sequences on data 179', '205: FastQC.html', '179: FASTQ Groomer on data 173', '173: 454reads\_test.fastq', '172: s 4 cut 100000.mfq', '171: s 3 cut 100000.mfq', '170: s 3 cut.mfq', '169: s 4 cut.mfq', '155: f1cond2.tsv', '154: f1cond1.tsv', '62: reference.mfa', and '61: annotation.gff'. The bottom of the main workspace contains the text: 'The Galaxy team is a part of BX at Penn State. This project is supported in part by NSF, NHGRI, and the Huck Institutes of the Life Sciences.'

## Pipeline of Differential expression analysis using DESeq

[MATLAB](#)

[CompareOverlapping \(S-MART\)](#)

**DESeq**

DESeq is an [R](#) package to analyse count data from high-throughput sequencing assays such as RNA-Seq and test for differential expression.

The package is available via [Bioconductor](#) and can be conveniently installed as follows:

Start an R session and type

```
source("http://www.bioconductor.org/biocLite.R")
biocLite("DESeq")
```

The package home page of DESeq is [here](#).

For usage instructions, see the package vignette available from the package home

For a description of the statistical method, see our paper:

Simon Anders, Wolfgang Huber: *Differential expression analysis for sequence data using DESeq*. *Genome Biology* 11 (2010) R106, [doi:10.1186/gb-2010-11-10-r106](https://doi.org/10.1186/gb-2010-11-10-r106) (open access)

See also the appendix of the vignette for a description of changes to the method since version 1.10.0.

Author: [Simon Anders](#); Last change: 2012-06-21.

### Running workflow "Differential\_expression\_DESeq (without replicates)"

Expand All Collapse

This pipeline allows an analysis of differential expression with two different condition samples ( For now, only with no biological replicates ).

One reference genome (fasta format), one annotation (gff format) and two RNA-seq samples are demanded.

**Step 1:** Convert the RNA-seq files to an identical fastq format (illumina, sanger or solixa).

**Step 2:** Mapping the RNA-seq samples with the genome reference, in using Tophat (Galaxy tool for mapping RNA-seq).

**Step 3:** Convert the bam files (given by Tophat) to sam type files.

**Step 4:** Count the number of overlap s between RNA-seq and annotation in using S-MART tool (CompareOverlapping).

**Step 5:** Differential expression analysis in using DESeq, and visualize graphically the results.

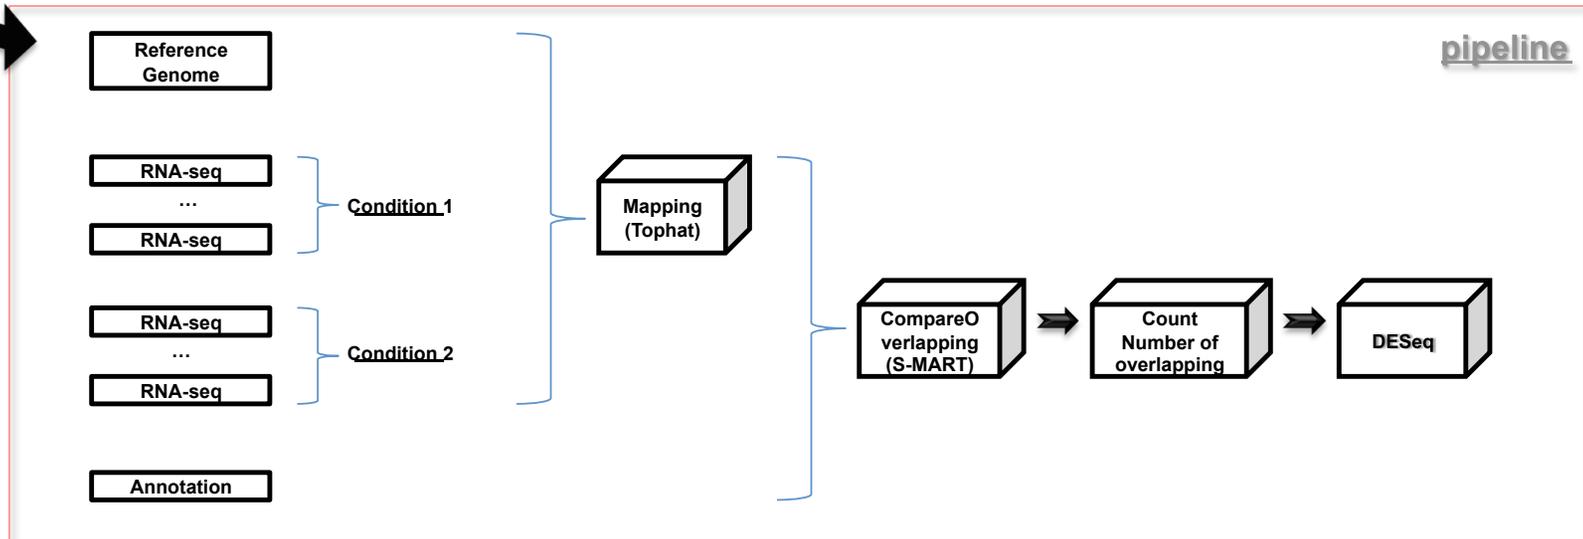

**Step 1: Input dataset**

This step is to identify unique RNA-seq samples of the first condition. The RNA-seq sample is formatted to be in fastq format.
